9	It is sometimes desirable to encrypt a design for loading into a PLD so that
9	It is sometimes desirable to encrypt a design for loading into a 1 LD so that
10	an attacker may not learn and copy the design as it is being copied into the PLD.
11	According to the invention, a method for generating a bitstream for storing an
12	encrypted design begins by generating an unencrypted bitstream including bits
13	representing the design and bits that control loading of the design. The bits
14	representing the design are encrypted and are combined with the bits that control
15	loading, which are not encrypted.
